

Assignment # 01

Q: Write a program that creates 2 child processes to calculate grades of students of mathematics class. The parent process will send the array to one child process to calculate the percentage of marks out of 250 total. The other child process will assign the grade A+>=90, A>=80, B>=70, C>=60, D>=50, F< and send result to parent process for sorting in ascending order and display the final result of the students. Class strength of 50 students

- Declare and initialize the array
- Each child process should run on a separate CPU
- Binding process to a CPU called affinity

Q: What is operating systems and how operating system do manages Process?
